S1 Dataset Availability

The complete IndoLepAtlas dataset, including images, annotations, and meta-data, is publicly available at: [IndoLepAtlas \(Hugging Face\)](#).

S2 Extended Dataset Statistics

S2.1 Taxonomic Distribution

The IndoLepAtlas dataset encompasses 60,641 images of butterflies across 967 species and 6 families. Additionally, it contains 703 images of 129 larval host plant species. The distribution of butterfly images by family is highly skewed towards Nymphalidae (29.8%) and Lycaenidae (28.0%), reflecting their prevalence in the Indian subcontinent.

Table S1. Detailed taxonomic distribution of butterfly species in IndoLepAtlas.

Family	Number of Images	Percentage (%)
Nymphalidae	18,054	29.8
Lycaenidae	16,985	28.0
Hesperiidae	12,361	20.4
Pieridae	6,132	10.1
Papilionidae	5,826	9.6
Riodinidae	1,132	1.9
Total	60,490	100.0

S2.2 Geographic Distribution

Geographic metadata was mapped to 9 distinct biogeographic zones defined by the Wildlife Institute of India. The dataset exhibits strong geographic bias,

with Maharashtra (10,198 images), Karnataka (8,121 images), and Kerala (6,795 images) heavily represented, primarily covering the Western Ghats and Deccan Peninsula.

S2.3 Temporal Distribution

Observations peak heavily during the post-monsoon season (October: 7,228 images; November: 5,654 images) and pre-monsoon summer (April: 4,654 images), aligning with known periods of high Lepidoptera activity in India.

S3 Detailed Model Architectures and Hyperparameters

S3.1 Architectural Details

The proposed baseline model builds upon a ConvNeXt-Tiny backbone pretrained on ImageNet.

- **Backbone:** ConvNeXt-Tiny, outputting features from four stages with channel dimensions [96, 192, 384, 768].
- **Coordinate Attention (CA):** Inserted after each of the four stages. A reduction ratio of 32 is used. CA decomposes channel attention into two 1D feature encoding processes along height and width, preserving spatial information critical for identifying localized wing patterns.
- **Multi-Level Feature Interaction (MLFI):** Detail Information Supplement (DIS) branches extract features from all four stages using adaptive max pooling (size 4x4) and fully connected layers. Features are concatenated in proportions 2:4:1:8, yielding a 1440-dimensional visual feature vector.
- **Geotemporal Fusion:** A learned embedding layer maps 9 biogeographic zones to a 32-dimensional dense vector. Month of observation is cyclically encoded as $[\sin(2\pi M/12), \cos(2\pi M/12)]$. The 1440-dim visual, 32-dim spatial, and 2-dim temporal vectors are concatenated and passed through a LayerNorm before the final classification head.

S3.2 Training Configurations

All models were trained on a DGX V100 cluster. The final comparative models (Table 6 in the main text) were trained with the following hyperparameters:

Table S2. Hyperparameter configurations for the benchmarked models.

Parameter	ResNet-101	EfficientNet-B5	ViT-B/16	MLFI Warmup	Geo-Shuffled	Geotemporal (Ours)
Image Size	224	224	224	224	224	224
Epochs	40	40	40	40	40	40
Batch Size	32	32	32	32	32	32
Grad Accum Steps	4	4	4	4	4	4
Learning Rate	1e-4	1e-4	1e-4	1e-4	1e-4	1e-4
LR Scheduler	Cosine	Cosine	Cosine	Cosine	Cosine	Cosine
Warmup Epochs	5	5	5	5	5	5
Weight Decay	0.05	0.05	0.05	0.05	0.05	0.05
Dropout	0.3	0.3	0.3	0.3	0.3	0.3
Loss Function	CE	CE	CE	CE	CE	CE
Label Smoothing	0.1	0.1	0.1	0.1	0.1	0.1
Sampling	Balanced	Balanced	Balanced	Balanced	Balanced	Balanced
Freezing	None	None	None	None	None	None

For the MLFI Warmup configuration, newly initialized MLFI layers were given full learning rates while the pretrained backbone was initialized at $0.1 \times$ the base learning rate to prevent catastrophic forgetting of ImageNet representations during the initial convergence phase.

S4 Per-Epoch Training Curves Data

The following table presents the per-epoch training metrics for the final Geotemporal Fusion model.

Table S3: Training progression of the Geotemporal model (40 epochs).

Epoch	Train Loss	Val Loss	Train Acc	Val Acc	Val F1	Val Precision
0	6.7747	6.4821	0.0141	0.0272	0.0125	0.0154
1	5.9179	5.6410	0.1101	0.1034	0.0702	0.0965
2	4.7798	4.5976	0.2936	0.2626	0.1895	0.2276
3	3.6095	3.6075	0.4831	0.4047	0.3418	0.3859
4	2.7276	2.8010	0.6297	0.5598	0.5028	0.5488

39	1.1817	1.4952	0.9891	0.8936	0.8670	0.8777

S5 Annotation Protocol and Verification

Annotations were generated semi-automatically using Grounding DINO with text prompts ("butterfly . moth . caterpillar . pupa . chrysalis" for Lepidoptera subjects). The dataset underwent a quality verification process:

1. 100 random images per subset were spot-checked to verify bounding box coverage.
2. Images where automated detection failed were flagged.
3. Flagged images were manually re-annotated using CVAT.
4. Species labels were inherited directly from the expert-curated source directory structure to ensure taxonomic accuracy.

Metadata including species names, location, date, and life stage was extracted via OCR from the original image overlays.

S6 Additional Confusion Matrix Analysis

Our analysis reveals that the most frequent misclassifications occur strictly within congeneric species pairs where morphological overlap is extreme. The geotemporal branch successfully resolves several of these pairs by exploiting biogeographic disjoints. For instance:

- *Kallima inachus* vs. *Kallima horsfieldii*: These dead-leaf butterflies are visually near-identical. However, *K. inachus* is found in the Himalayas, while *K. horsfieldii* is endemic to the Western Ghats. The geotemporal model leverages the zone embedding to disambiguate them.
- *Pachliopta aristolochiae* (Common Rose) vs. *Pachliopta pandiyana* (Malabar Rose): *P. pandiyana* is endemic to the Western Ghats, while *P. aristolochiae* is widespread.

S7 Datasheet for Datasets (Data Card)

S7.1 Motivation

The dataset was created to address the severe underrepresentation of Indian Lepidoptera in global biodiversity repositories (e.g., iNaturalist) and to provide a high-quality benchmark for fine-grained biological classification that incorporates geotemporal metadata.

S7.2 Composition

The dataset comprises 60,641 images of butterflies across 967 species, and 703 images of 129 larval host plant species. Instances represent individual biological observations, with metadata specifying location (state), observation date, and life stage.

S7.3 Collection Process

Images and metadata were scraped from the expert-curated [Indian Lepidoptera web atlas](#). The data was subsequently filtered, taxonomically verified, and augmented with bounding boxes.

S7.4 Preprocessing/Cleaning

GPS coordinates were binned into 9 discrete biogeographic zones. Dates were converted into a cyclic month encoding. Missing values were preserved and represented using learned “unknown” embeddings during model training.

S8 Full Species List

The following is a complete list of the Lepidoptera and host plant species included in IndoLepAtlas.

Table S4: Full species list

Species 1	Species 2	Species 3
<i>Abisara attenuata</i>	<i>Abisara bifasciata</i>	<i>Abisara burnii</i>
<i>Abisara chela</i>	<i>Abisara echerius</i>	<i>Abisara fylla</i>
